please tuck this forwarded email into a "later" file but at some point, I really want to speak about it to you.

I'm pleased that it is accepted by MSMA and I would like to know what the peer reviewers said. When something is too good to be true, it usually isn't. As I said to Michael, Dr. Hayek rightly presents his patients as vulnerable. Also, these patients have what must be one of the lowest medical literacy rates of any population. Yet they followed a pretty tight schedule of drugs, and visits, and follow-ups. If nothing else, the trial world should learn from this as to how to run a study with no dropouts and other remarkable results.

I guess what I am saying, it needs a deep audit and peer review and if completely valid the results should be in all the major journals and on the nightly news.

Greetings Dr Waites.

Indeed we have no deaths or ICU on the Outpatient regimen.

In the above correspondence, you may be referring to the data I had forwarded last week showing a mortality of 8.4%. This data is a representation of our InPatient total Covid mortality from December 2020 to June 2021.

We have presented the outpatient regimen for publication to the MSMA journal. It was just accepted yesterday afternoon.

I have attached a copy of the manuscript.

Since submission we are now at about 1500 Out patients treated with about a 3% admission rate, yet still no ICU admission or Deaths.

A significant consequence of the regimen is its direct impact on our hospital and ICU Census. Currently we have about 25 inpatient Covid (7 of which are intubated in ICU). During July 2020(The first peak) we peaked at 52 patients with 12 in ICU. With current volumes we should be well above the July 2020 numbers in the hospital. Thanks to Dr Corkern's work (and our coordination with all providers in Washington county since December 2020) patients are successfully managed in the outpatient setting.

Those admitted are vastly direct ER hypoxemic patients that never presented for outpatient evaluation.

As reference, the most recent published experience using Monoclonal AB on 233 patients similar to our reported cohort (High risk) shows an admission rate of nearly 6% and a mortality rate for those admitted of 24 % (ref 23 in the attached paper).

I have requested from Dr Camp-Rogers to consider the manuscript for rapid publication, I am awaiting an answer.

I have attached the accepted paper for your review.

As for the data, we stand ready to submit it immediately. Our medical records director Mrs. Iris stacker (Istacker@Deltahealthsystem.org) informs me that keeping up with HIPPA, it would be best to submit a direct request to her.

The data set is ready and can be forwarded promptly upon Mrs Stacker's receipt (Excel format) of an official request for the health department.

Thank you,

Maroun

Attached is communication with Dr Thad Waites. I think the next step is to send him the data as requested and let them give us some feedback.

GREAT RESULTS. Certainly the no deaths (I thought your earlier numbers included a tiny percent of deaths). Could you, or your team, send me the raw numbers and I absolutely will get with Dobbs and Byers. I think you should consider getting with MSMA and join them on the Friday show.

Hope you can give us guidance on where to go with our outpatient treatment protocol. We have over 1500 treated outpatients with 15 admissions and no deaths.

It would be great if MSDH could look at our data and give us some direction on what to do with our protocol. We just have not seen any negative effects from treatments like ivermectin at standard anti parasite dosing. We want to help people as much as we can. Certainly don't want to cause problems.

Thanks for your leadership

Michael
